

## Week 5 Problem Set

### Graphs and Trees

[Show with no answers] [Show with all answers]

#### 1. (Graph properties)

True or false?

- The complete bipartite graph  $K_{5,5}$  has no cycle of length five.
- If you add a new edge to a cycle, the resulting graph will always contain a 3-clique.
- It is possible to remove two edges from  $K_6$  so that the resulting graph has a clique number of 4.
- There are exactly 3 automorphisms of  $K_3$ .

[hide answer]

- True.** In general, any bipartite graph can only have cycles of an even length. If  $V_1, V_2$  denote the two groups of nodes in the bipartite graph, then every path starting from, say, a node  $v \in V_1$  must alternate its vertices between  $V_1$  and  $V_2$ . If it is a cycle (that is, eventually returns to node  $v$ , it must have an even number of such alternations, in other words, it contains an even number of edges).
- False.** For example, a cycle  $C_6$  will still have a clique number of 2 (i.e., no 3-cliques) after adding an edge between two nodes that are 3 edges apart.
- True.** Remove any two edges which have no common vertex. In the resulting graph there will be no five fully interconnected vertices; in other words it will not contain  $K_5$ , and will have a clique number of 4.
- False.** There are 6 automorphisms of  $K_3$ , one for each permutation of the vertices:

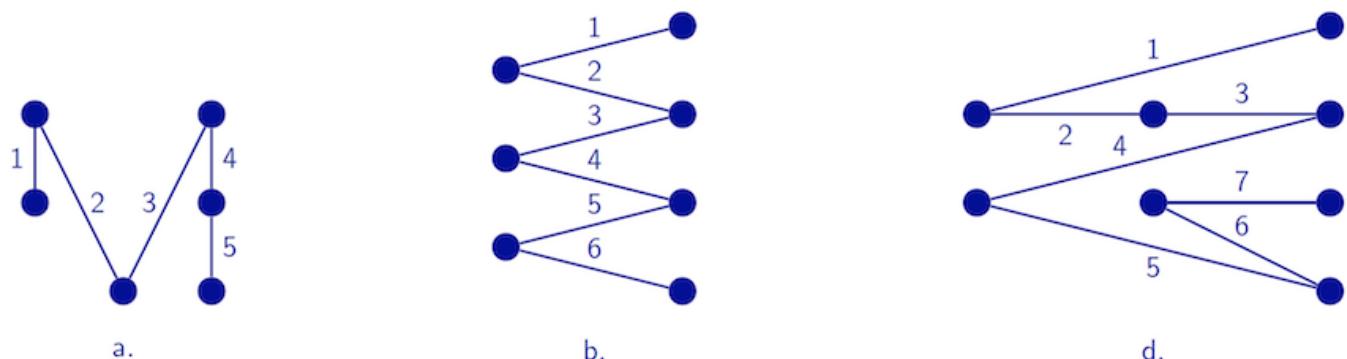

- $v_1 \mapsto v_1, v_2 \mapsto v_2, v_3 \mapsto v_3$
- $v_1 \mapsto v_1, v_2 \mapsto v_3, v_3 \mapsto v_2$
- $v_1 \mapsto v_2, v_2 \mapsto v_1, v_3 \mapsto v_3$
- $v_1 \mapsto v_2, v_2 \mapsto v_3, v_3 \mapsto v_1$
- $v_1 \mapsto v_3, v_2 \mapsto v_1, v_3 \mapsto v_2$
- $v_1 \mapsto v_3, v_2 \mapsto v_2, v_3 \mapsto v_1$

#### 2. (Graph traversal)

For each of the following graphs, show a Hamiltonian path or argue why no such path exists.

- The graph on slide 18 (week 5).
- $K_{3,4}$
- $K_{1,4,1}$
- $K_{2,2,4}$
- A graph with 5 nodes and degree sequence 0, 0, 5.
- A tree with 5 nodes and degree sequence 0, 3, 1, 1.

[hide answer]

- There is no Hamiltonian path in  $K_{1,4,1}$ : Even if you start with one of the 4 vertices in the largest partition, you can visit at most 3 of them before you have to return to a previously visited vertex from one of the other two partitions.
- Any graph on 5 nodes and where each node has degree 2 constitutes a cycle  $C_5$ , which is a Hamiltonian path by itself.

- f. The top right tree on slide 17 (week 5) is the only tree on 5 nodes that has one vertex of degree 3, one vertex of degree 2 plus three vertices of degree 1. This tree has no Hamiltonian path since you have to go through the top node at least twice in order to visit all three nodes of degree 1.

### 3. (Graph colouring)

For each of the following graphs  $G$ , determine its chromatic number  $\chi(G)$ .

- The graph on slide 18 (week 5).
- A graph obtained by adding one new edge to  $C_4$ .
- A graph obtained by removing one edge from  $K_{2,2}$ .
- A graph obtained by removing one edge from  $K_4$ .

[hide answer]

- The graph has a 3-clique, hence 3 colours are necessary. It is easy to find such a 3-colouring, hence  $\chi(G) = 3$ .
- $\chi(C_4) = 2$ , but with one edge added the graph will have a 3-clique, hence  $\chi(G) = 3$ .
- Removing one edge from  $K_{2,2}$  results in a tree, hence  $\chi(G) = 2$ .
- $\chi(K_4) = 4$ , but if one edge  $(v,w)$  is removed, then  $v$  and  $w$  can be coloured the same, hence  $\chi(G) = 3$ .

### 4. (Planar graphs)

True or false?

- A forest is always planar.
- All graphs with 6 nodes and 8 edges are planar.
- All graphs whose clique number is 2 are planar.
- You can obtain a nonplanar graph by adding 3 edges to a cycle.
- When you remove two edges from  $K_6$ , you will never obtain a planar graph.
- All graphs whose chromatic number is 4 are planar.

[show answer]

### 5. (Constructing graphs)

A graph  $G$  is a **2-3 tree** if:

- $G$  is a rooted tree.
- Each node has either 2 or 3 children (unless it is a *leaf* node, which has no children).
- All paths from the root to the leaves have the same length.

There are seven different types of 2-3 trees of height 2 (i.e., which are non-isomorphic). Draw one tree of each type.

[show answer]

### 6. Challenge Exercise

- What is the minimum number of edges that need to be removed from  $K_5$  so that the resulting graph has a chromatic number of
  - 3 ?
  - 2 ?
  - 1 ?
- Give a planar drawing of  $K_{2,2,2}$ . Can you find one with only straight lines?

[show answer]

### 7. Mid-term practice test

To prepare for the mid-term online test on **Friday, 27 March, 2:30pm** go to [COMP9020 20T1 Practice Test](#) to see 3 sample questions.

Note:

- The practice test will automatically close 1 hour (60 minutes) after you have started it, just like the mid-term test will.
- The practice test will end on Thursday, 26 March, 10:00am. It will no longer be available afterwards.

- Your answers to the open questions will not be marked, but you will get to see sample solutions after the practice test has ended on Thursday.

## Assessment

After you have solved the exercises, go to **COMP9020 20T1 Quiz Week 5** to answer 4 quiz questions on this week's problem set (Exercises 1-5 only) and lecture.

The quiz is worth 2.5 marks.

There is no time limit on the quiz once you have started it, but the deadline for submitting your quiz answers is **Thursday, 26 March 10:00:00am**.

Please continue to respect the **quiz rules**:

Do ...

- use your own best judgement to understand & solve a question
- discuss quizzes on the forum only **after** the deadline on Thursday

Do not ...

- post specific questions about the quiz **before** the Thursday deadline
- agonise too much about a question that you find too difficult
